Professional Profile

Alex Morgan | Senior Platform Engineer

Synthetic test profile. All people, employers, schools and projects in this document are fictional. Email: alex.morgan@example.com. Location: Example City.

Summary

Platform engineer with eight years of experience building internal developer platforms, operating Linux services and automating infrastructure. Focus areas include reliable releases, monitoring and database operations.

Technical Skills

Linux, Python, Bash, Git, Docker, Kubernetes, Terraform, Ansible, PostgreSQL, MySQL, Redis, Nginx, Prometheus, Grafana, Jenkins and continuous integration.

Education

Bachelor of Science in Computer Science, Example Technical University, September 2012 to June 2016. Coursework included operating systems, networks, databases and software engineering.

Professional Practice

Maintained incident playbooks and documented service dependencies. Reviewed infrastructure changes with application teams. Used capacity measurements to plan upgrades and tested recovery procedures before releases.

Employment History

Senior Platform Engineer | Example North Systems

January 2023 to September 2026. Built deployment templates for internal services. Operated Kubernetes clusters and maintained monitoring. Led incident reviews and improved recovery documentation.

Site Reliability Engineer | Example West Labs

July 2020 to December 2022. Automated Linux configuration with Ansible. Managed PostgreSQL backups and tested restoration. Developed Python utilities for service checks.

Systems Engineer | Example East Software

July 2018 to June 2020. Maintained containerized applications. Implemented CI workflows and release approvals. Investigated application latency using metrics and logs.

Junior Operations Engineer | Example South Services

July 2016 to June 2018. Supported Linux hosts and Nginx configuration. Assisted with database maintenance and incident response. Documented repeatable operational tasks.

Selected Projects - Platform

Internal Deployment Platform

Employer: Example North Systems. Role: implementation and operations. Designed reusable deployment templates and release checks using Kubernetes, Docker and Git. Coordinated application onboarding and documented rollback procedures.

Metrics Platform

Employer: Example North Systems. Role: implementation and operations. Built Prometheus collection rules and Grafana dashboards. Defined actionable alerts and reviewed them after incidents.

Database Recovery Program

Employer: Example West Labs. Role: implementation and operations. Automated PostgreSQL backups and periodic restoration tests. Recorded recovery duration and validated application access after restore.

Configuration Management

Employer: Example West Labs. Role: implementation and operations. Created Ansible roles for Linux configuration. Used review and staged rollout to reduce configuration drift.

Selected Projects - Reliability

Container Migration

Employer: Example East Software. Role: implementation and operations. Moved internal services into Docker containers and documented resource requirements. Validated networking and persistent data behavior.

Release Pipeline

Employer: Example East Software. Role: implementation and operations. Implemented Jenkins workflows for tests, artifact handling and release approvals. Added clear failure reporting for developers.

Service Health Checks

Employer: Example South Services. Role: implementation and operations. Wrote Python scripts for endpoint checks and scheduled maintenance reports. Used bounded retries and explicit timeouts.

Log Investigation Toolkit

Employer: Example South Services. Role: implementation and operations. Created Bash utilities to summarize operational logs. Documented incident investigation steps without retaining sensitive application content.

Selected Projects - Automation

Capacity Review

Employer: Example North Systems. Role: implementation and operations. Measured CPU and memory usage for representative workloads. Prepared capacity reports and verified behavior under controlled load.

Developer Documentation

Employer: Example North Systems. Role: implementation and operations. Created onboarding guides and examples for internal platform users. Reviewed instructions with new team members and corrected unclear steps.
